                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ORGANISM
                                                                                                                                                   Bource
                                                                                                                                                                                                                                                                                                                                                                                                                        During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest, except on the rare occasion of the clone being a YAC.

The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases:

Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CR318586 JO205 bp DNA linear VRT 09-APR-200 Zebrafish DNA sequence from clone CH211-239022 in linkage group 7,

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The invention relates to to a cell-free protein synthesis system derived from wheatgerm where there is substantial exclusion of wheatgerm embryo albumen impurities. The novel system uses a sequence having a higher-order RNA structure that promotes translation activity. The higher-order sequence is preferably a "pseudoknot", especially derived from a range of

a range of

Cell-free protein synthesis means in wheatgerm system to establish overexpression of target gene with base sequence sustaining translation activity and function promotion, for producing useful proteins.

Claim 1; Page 34; 39pp; Japanese.

              have a higher-order structure that sustains translational activity-
promoting function. The RNA sequences of the invention are useful in the
synthesis of proteins and polypeptides for application in developing and
producing drugs. The RNA sequences of the invention are also useful in
                                                                                                                                                                                                                                                      Translational activity-promoting higher-order structure of CrPV-like viruses for protein translation when suitably initiated, useful in synthesis of proteins and polypeptides of foreign species for application

This sequence represents the "pseudoknot" higher-order sequence from the Black queen-cell virus. The sequence is used in a construct which may also include an intergenic region and internal ribosome entry site (IGR-IRES). The method is applicable in

The invention relates to to a cell-free protein synthesis system derived from wheatgerm where there is substantial exclusion of wheatgerm embryo albumen impurities. The novel system uses a sequence having a higher-order RNA structure that promotes translation activity. The higher-order sequence is preferably a "pseudoknot", especially derived from a range of viruses (ABZ80707-ABZ80713). This sequence represents the "pseudoknot" higher-order sequence from the Cricket paralysis virus. The sequence is used in a construct which may also include an intergenic region and internal ribosome entry site (IGR-IRES). The method is applicable in
                                                                                                                                                                                                                                                                                          Cell-free protein synthesis means in wheatgerm system to establish overexpression of target gene with base sequence sustaining translactivity and function promotion, for producing useful proteins.
                                                                                                                                                                                                                                                    Claim 1; Page

                                                The invention comprises seven RNA sequences (CrPV-like viruses) which have a higher-order structure that sustains translational activity-promoting function. The RNA sequences of the invention are useful in the synthesis of proteins and polypeptides for application in developing and producing drugs. The RNA sequences of the invention are also useful in basic research of protein synthesis and structural analysis by the gene recombinant technique. The present nucleotide represents a Cricket paralysis virus RNA sequence of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Cricket paralysis virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CrPV-like virus; 88; higher-order structure; drug development; drug production; translational activity-promoting function;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Cricket paralysis virus RNA sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              19-DEC-2002
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAL50547;
                                                                                                                                                                                                                                                                                                         Claim 1;
                                                                                                                                                                                                                                                                                                                                                                                                                Translational activity-promoting higher-order structure of CrPV-like viruses for protein translation when suitably initiated, useful in

                                                                               The invention relates to to a cell-free protein synthesis system derived from wheatgerm where there is substantial exclusion of wheatgerm embryo albumen impurities. The novel system uses a sequence having a higher-order RNA structure that promotes translation activity. The higher-order sequence is preferably a "pseudoknot", especially derived from a range of viruses (ABZ80707-ABZ80713). This sequence represents the "pseudoknot" higher-order sequence is used in a construct which may also include an intergenic region and internal ribosome entry site (IGR-IRES). The method is applicable in producing
                                                                                                                                                                                                                                                                                                                                                                                                                       Cell-free protein synthesis means in wheatgerm system to establish overexpression of target gene with base sequence sustaining translation activity and function promotion, for producing useful proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           albumen; impurity; higher-order structure; internal ribosome entry site; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches
                                                                                                                                  The invention comprises seven RNA sequences (CrPV-like viruses) which have a higher-order structure that sustains translational activity-promoting function. The RNA sequences of the invention are useful in the synthesis of proteins and polypeptides for application in developing an producing drugs. The RNA sequences of the invention are also useful in basic research of protein synthesis and structural analysis by the gene recombinant technique. The present nucleotide represents a Drosophila C virus RNA sequence of the invention
                                                                                                                                                                                                                                                                                                                Translational activity-promoting higher-order structure of CrPV-like viruses for protein translation when suitably initiated, useful in synthesis of proteins and polypeptides of foreign species for applications.
                                                                                                          Sequence

The novel system uses a sequence having a higher-order RNA structure that promotes translation activity. The higher-order sequence is preferably a "pseudoknot", especially derived from a range of viruses (ABZ80707-ABZ80713). This sequence represents the "pseudoknot" higher-order sequence from the himetoble pvirus. The sequence is used in a construct which may also include an intergenic region and internal ribosome entry site (IGR-IRES). The method is applicable in producing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Cell-free protein synthesis means in wheatgerm system to establish overexpression of target gene with base sequence sustaining translactivity and function promotion, for producing useful proteins.
                                                                                                                                                                                                                                                                                                                                                                   Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Claim 1; Page

                                                                                                                                                                                                                                                                                                                                                Sequence 199 BP;
                                                                                                                                                                                                                                                                                                                                                                                                                              The invention comprises seven RNA sequences (CrPV-like viruses) which have a higher-order structure that sustains translational activity-promoting function. The RNA sequences of the invention are useful in the synthesis of proteins and polypeptides for application in developing and producing drugs. The RNA sequences of the invention are also useful in basic research of protein synthesis and structural analysis by the gene recombinant technique. The present nucleotide represents a Himetobi P
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Nakashima N,

                                                                           The present sequence is mouse occyte protein 8 (MOP8) cDNA. The present invention relates to egg specific surface proteins (antigens) and nucleic acids encoding them. The proteins of the invention are involved in egg-sperm binding and fusion. They are useful as immunogens in vaccine preparation for modulating fertility. In particular, the proteins are useful for producing antibodies which are useful for temporary, reversible contraception methods. The contraceptive vaccine is especially important livestock, e.g. cattle or pig. The invention also relates to the use of antibodies against such antigens for active immunisation or sterilisation of female animals
                                                                                                                                                                                                                                                                         New egg-specific surface proteins, useful as immunogens in preparation for modulating fertility, particularly useful t antibodies for temporary, reversible contraception methods.
                                                                                                                                                                                                                                                                                                                                                                            Herr JC,

                                                                                                                                                                                                                     The invention relates to novel abiotic stress responsive polynucleotides cand polypeptides. Also disclosed are vectors, expression cassettes, host cells, and plants containing such polynucleotides. Also disclosed are methods for using the polynucleotides and polypeptides to alter the cresponsiveness of a plant to abiotic stress. The invention is useful in egriculture. The nucleic acid is useful for determining whether a test color than been exposed to an abiotic stress condition. It is also useful for selecting an agent that alters abiotic stress regulated polynucleotide expression in a plant cell, and to identify a homolog or ortholog to an abiotic stress responsive polynucleotide. The nucleic acid molecule and the polypeptide encoded by it are useful in altering the responsiveness of a plant to an abiotic stress, such as cold stress, salt stress, osmotic stress or any of their combinations. The present sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 S
